

What drives modeled gross profit?

Which products generate the most modeled gross profit, and is the result driven by sales volume, unit margin, or both?

Modeled gross profit = product price - component supply costs

Labour, rent, discounts, and overhead are not available in the source data.

997

items sold

\$6,818

item revenue

\$5,412

modeled gross profit

Every metric traces back to four raw sources

The DAG makes the calculation path visible and testable.

BEV-004 wins on volume and margin

Bubble size shows total modeled gross profit.

BEV-004

168 units
88.3% margin
\$1,038 gross profit

JAF-001

Highest margin: 89.0%
Only 37 units sold

1-16 September 2016

Protect the winner, test the margin opportunity

1

Protect BEV-004 availability

It contributes \$1,038.24, or 19.2% of modeled gross profit.

2

Run a controlled JAF-001 promotion

Test whether an 89.0% unit margin can support more volume without displacing stronger products.

dbt tests used

Keys: unique + not_null

Grain: date + SKU unique

Logic: subtotals, profit + margin

38 / 38 build nodes passed

686 / 686 subtotals reconciled

Limits: one store, 16 days, no operating costs.
